File Download Demonstration

Your download was successful!

Congratulations! If you're reading this document, you've successfully downloaded a PDF file using the CitOmni HTTP component.

This document is part of the **CitOmni Demo App** and demonstrates the functionality of the `Response::download()` method.

How It Works

The `Response::download()` method provides a simple, reliable way to deliver files from your application to the client.

It handles several important aspects of file delivery automatically.

- **File validation** - Verifies that the requested file exists and is readable.
- **Content detection** - Determines the file's MIME type when possible.
- **Download headers** - Sends appropriate HTTP headers, including the suggested filename and file size.
- **Safe filenames** - Supports UTF-8 filenames with an ASCII fallback.
- **Efficient streaming** - Streams file contents without loading the entire file into PHP memory.
- **Clean output** - Clears existing output buffers to prevent file corruption.

What This Demo Demonstrates

This PDF is a static sample document, delivered through CitOmni's HTTP response service.

The download method does not generate or modify the PDF. Its responsibility is to deliver the existing file to the client with the appropriate HTTP response.

Explore CitOmni

CitOmni is a modular PHP framework designed for performance, simplicity, and predictable behavior.

Discover the framework, explore its components, and learn more about building applications with CitOmni.
